Method Statement for the Construction of Bored Pile ...

Method statement of bored piles is a construction procedure which includes hole boring into the ground, installing steel reinforcement and casting with concrete to form a pile, etc. Bored piles are constructed in the ground by boring in the circular shape of designed diameters to transfer load from the superstructure into the ground through friction and end bearing.

Bored Piling Process . Installing a bored pile starts with drilling a vertical hole into the soil, using a bored piling machine. The machine can be outfitted with specially designed drilling tools, buckets, and grabs to remove the soil and rock. Piles can be drilled to a depth of up to 60 meters and a diameter of up to 2.4 meters.

For preliminary design purposes, BS 8004 gives presumed bearing values which are the pressures which would normally result in an adequate factor of safety against shear failure for particular soil types, but without consideration of settlement.

Bored piles(Replacement piles)are generally considered to be non- displacement piles a void is formed by boring or excavation before piles is produced. Piles can be produced by casting concrete in the void.

Pile Foundation Design[1]

Bored piles are drilled using buckets and/or augers driven by percussion boring (vibratory hammers) or through rotary boring (twisting in place). In unstable soil strata, the use of bentonite fluid assists in stabilising the bore especially in large diameter deeper piles and allows the insertion of heavily reinforcing steel cages.

Bored piles - Designing Buildings Wiki

The design of large-diameter bored piles appears to be relatively simple as the allowable bearing capacity and resistance to lateral earth pressure are limited by the presumptive values stated in Code of Practice for Foundations 2017 and related government publications.
